Model comparisons for the LHC

A. Andronic

2

Both SHM and TM reproduce the data
... $d\sigma_{c\bar{c}}/dy$ values rather different:
Stat. Hadr.: 0.3-0.4 mb
Transport: 0.5-0.75 mb (TAMU),
0.65-0.8 mb (Tsinghua)
needs clarification
important role of Λ_c (and excited states)
 T at generation:
SHM: 156 MeV
TM: 250 MeV (TAMU)

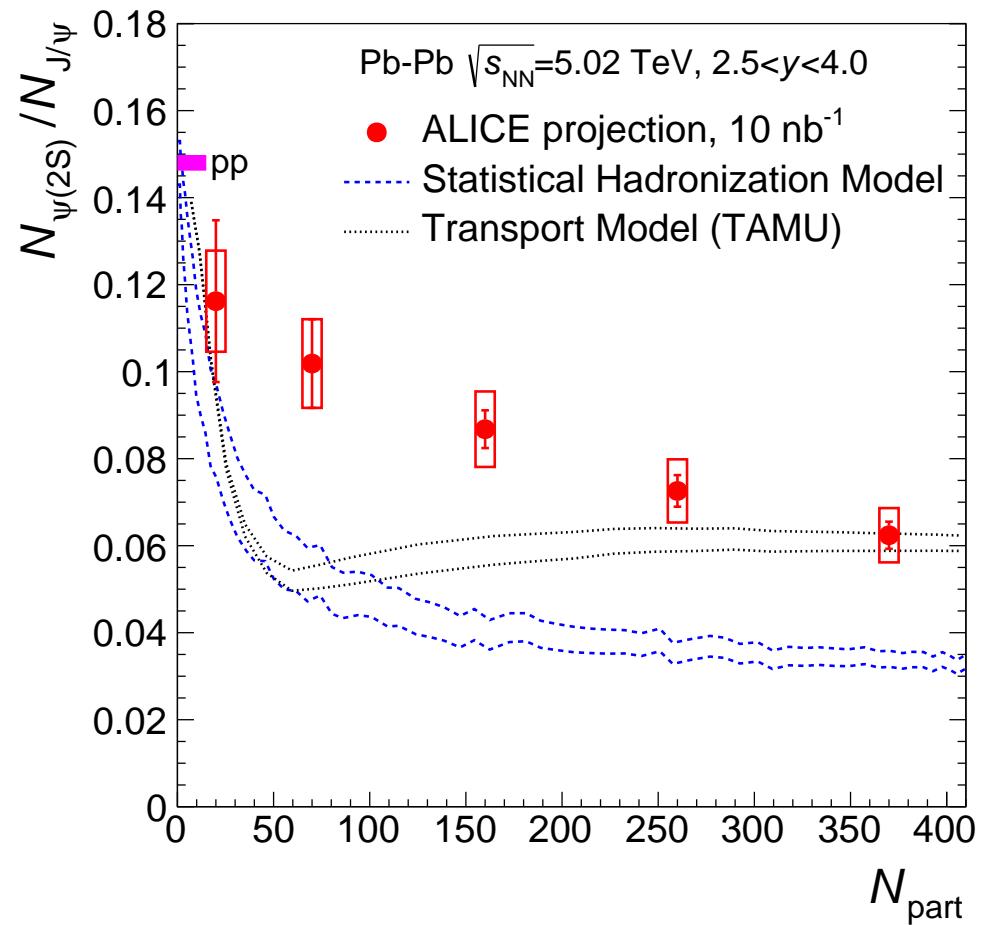

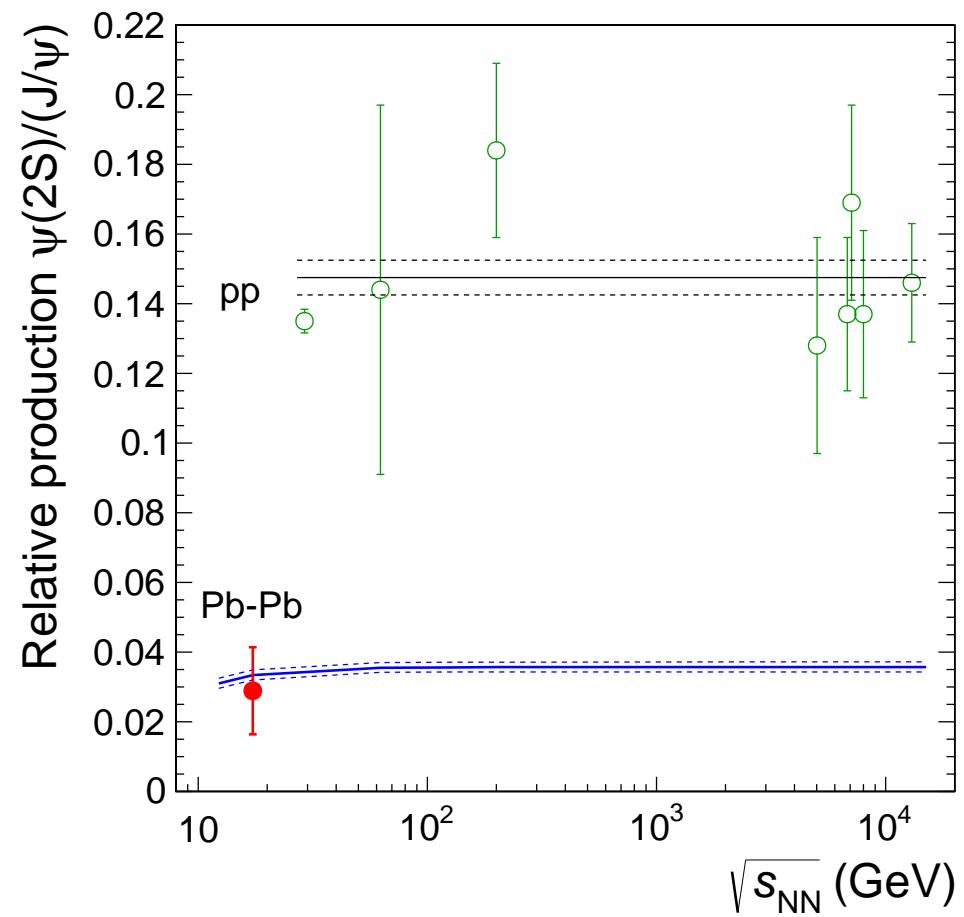

Discriminating the two pictures implies providing an answer to fundamental questions related to the fate of hadrons in a hot deconfined medium.

Future of charmonium in Pb–Pb

A. Andronic

3

Need: experimentally: better uncertainty for $d\sigma_{c\bar{c}}/dy$ (in Pb–Pb);
access to excited startes and hopefully also exotic states, like X(3872)

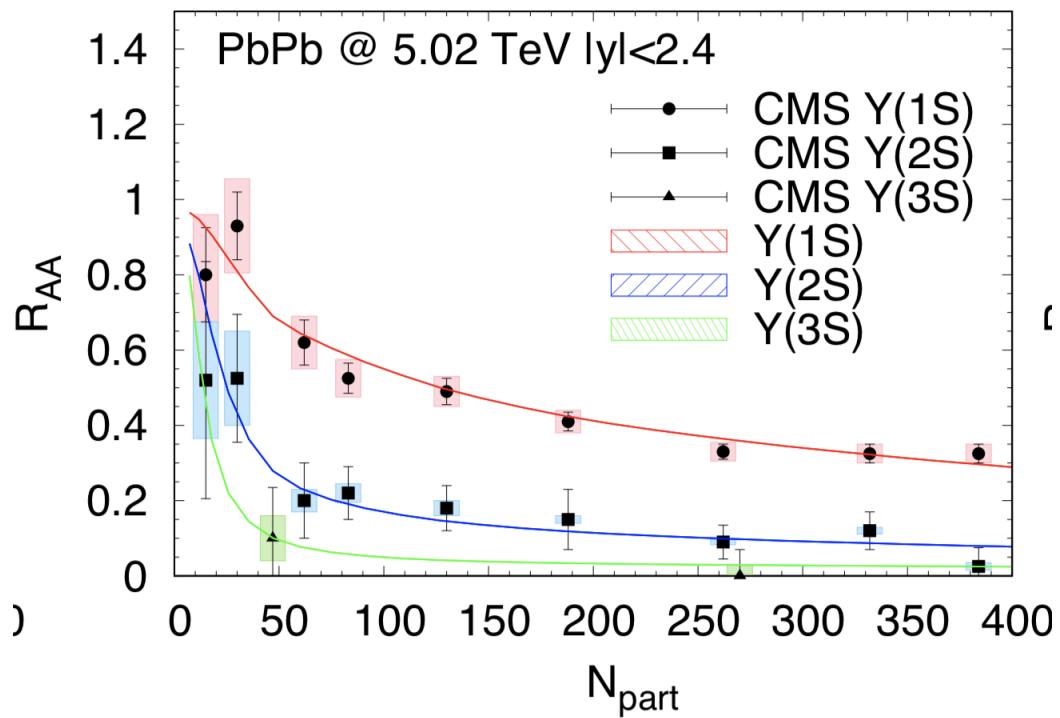

Theoretical direction: quantum treatment (charmonium and bottomonium)

Υ in Pb–Pb

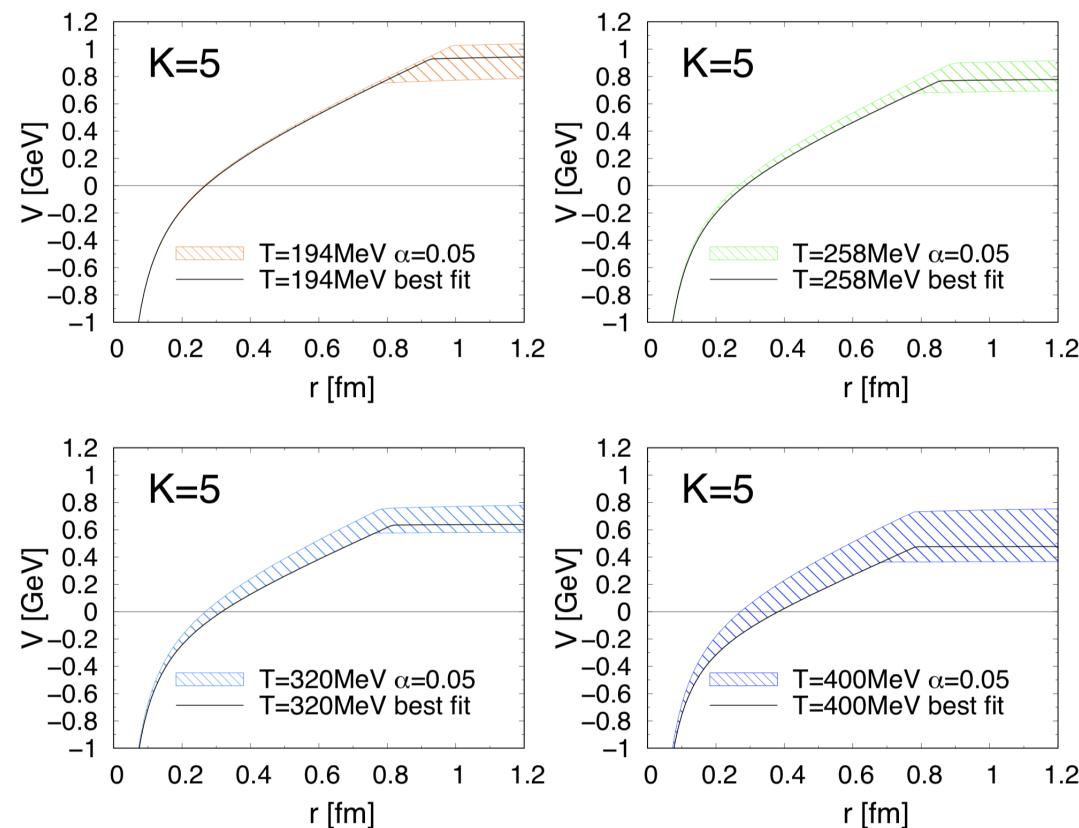

A. Andronic

4

...allows extraction of in-medium (Cornell) potential

(re)generation important for $Y(2S)$

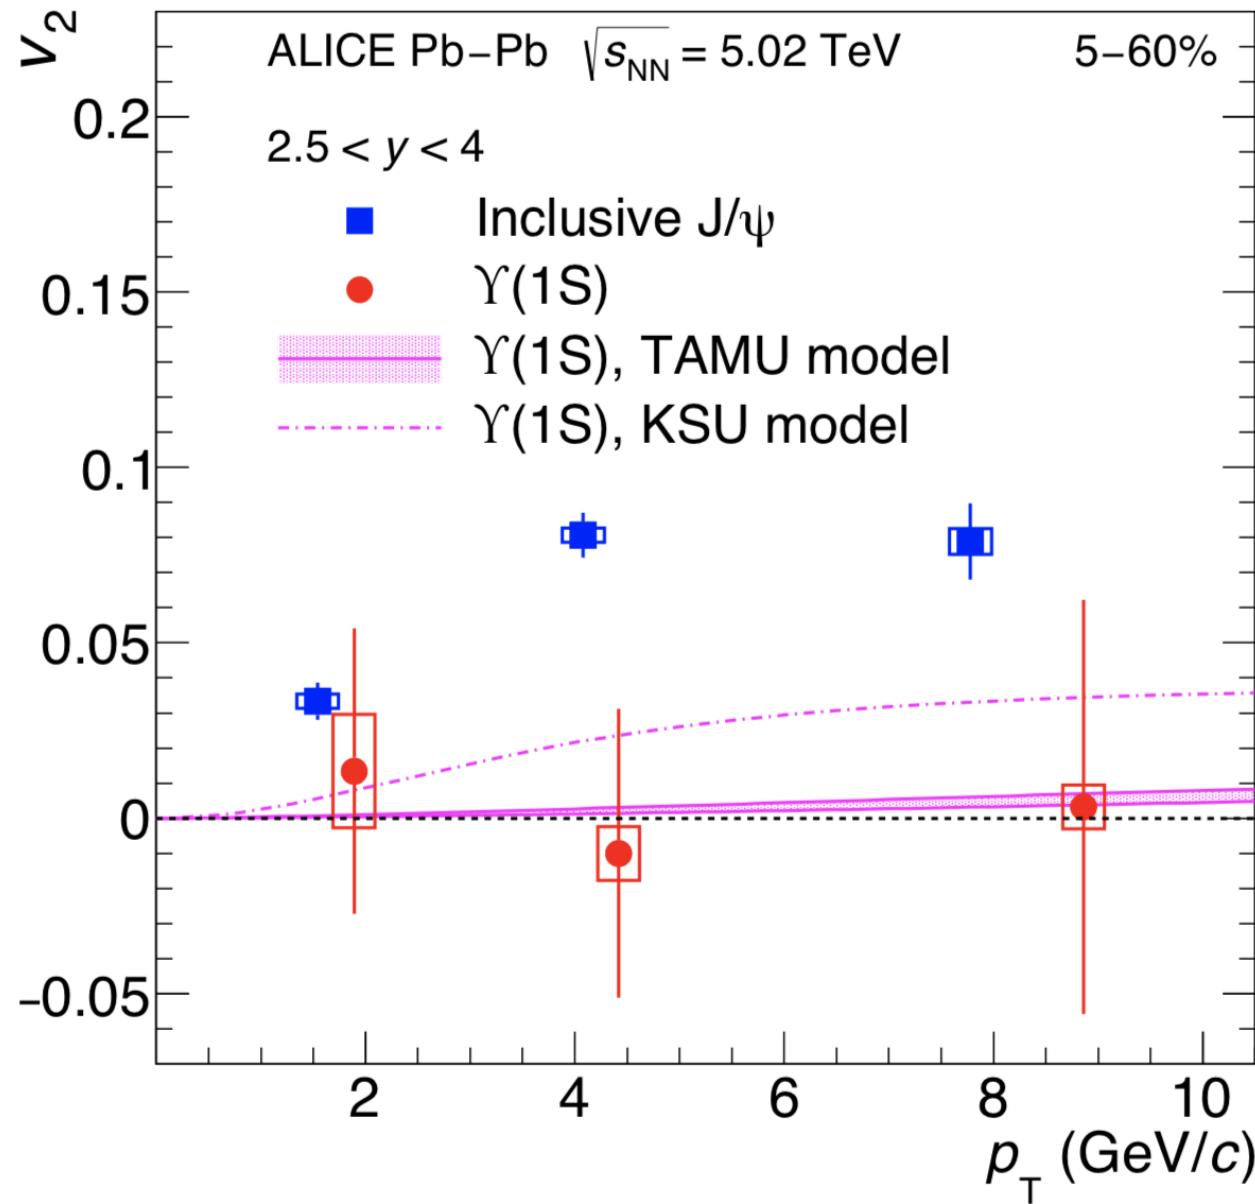

Transport Model (TAMU), Du, Liu, Rapp, Phys. Lett. B 796 (2019) 20

Substantial remnants of the long-range color confining force in QGP

Υ in Pb–Pb ...does it flow?

A. Andronic

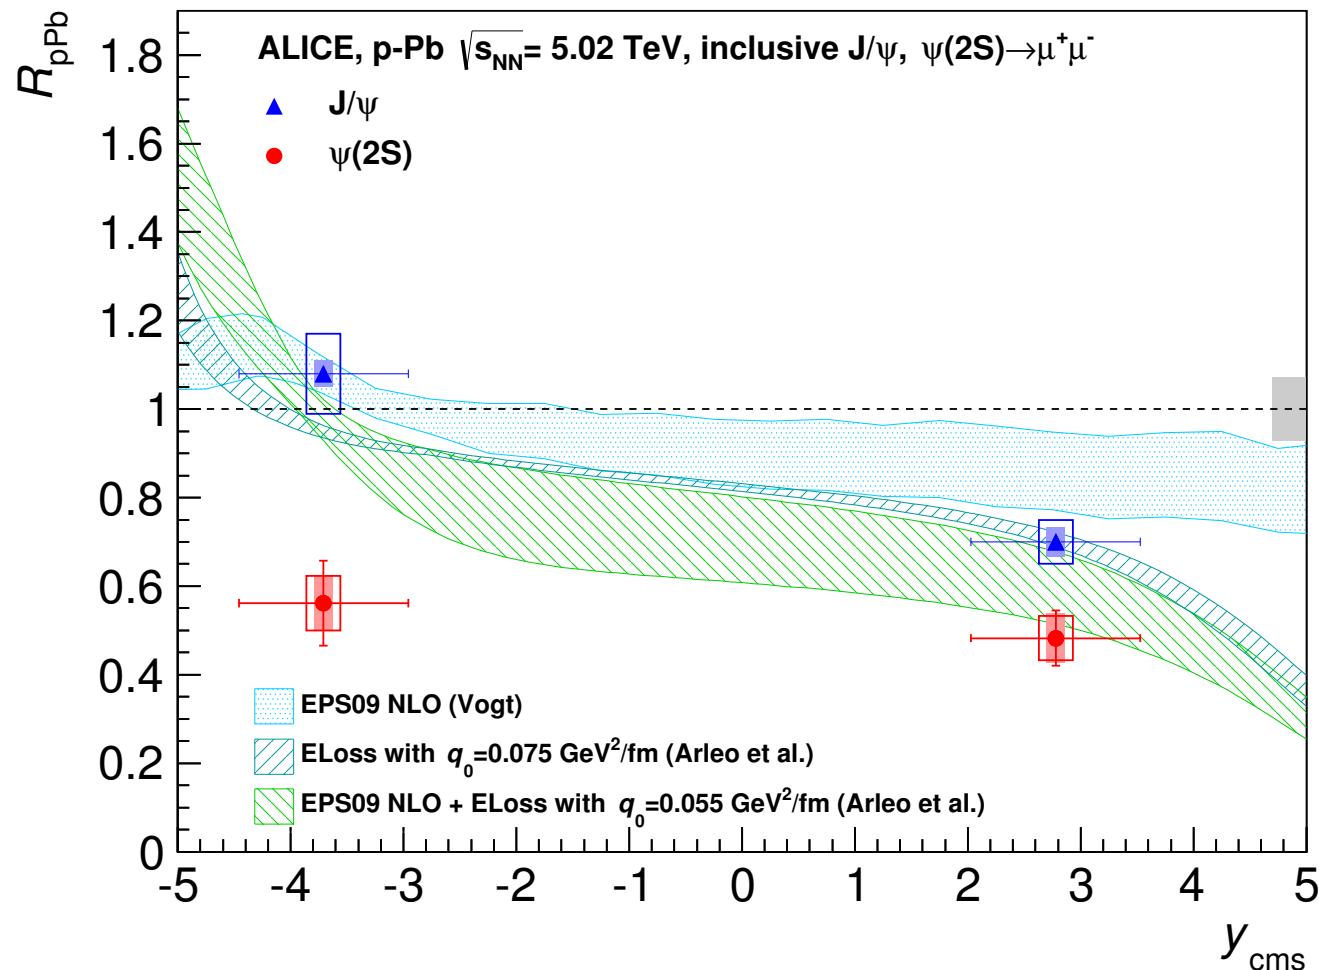

5

J/ψ and $\psi(2S)$ production in p–Pb collisions

A. Andronic

6

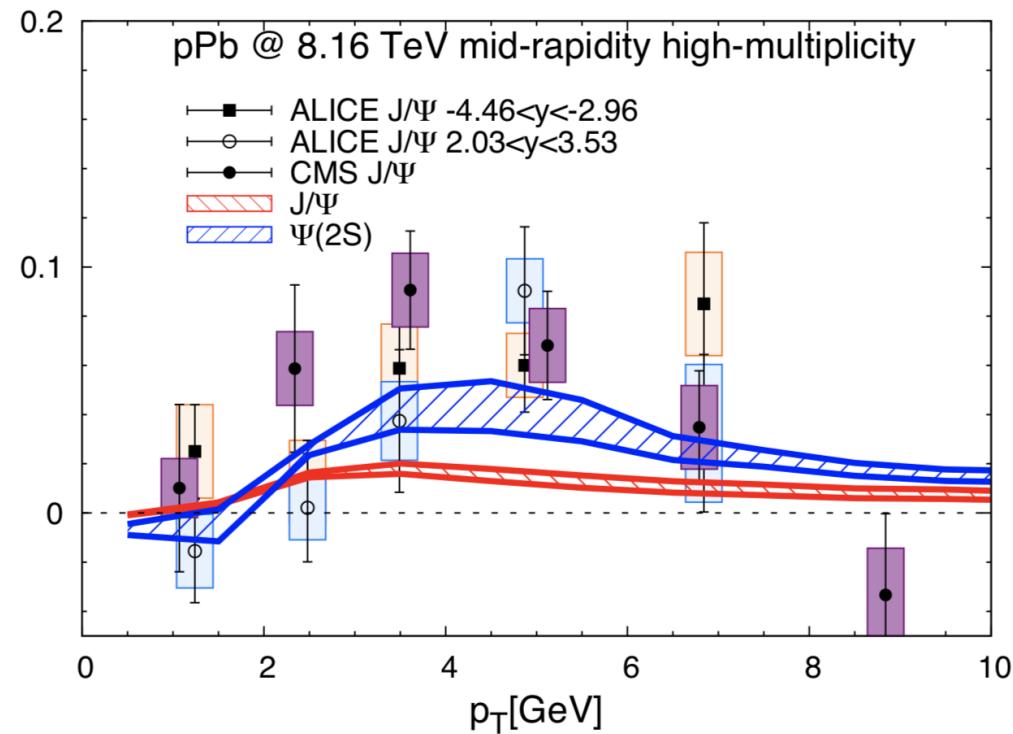

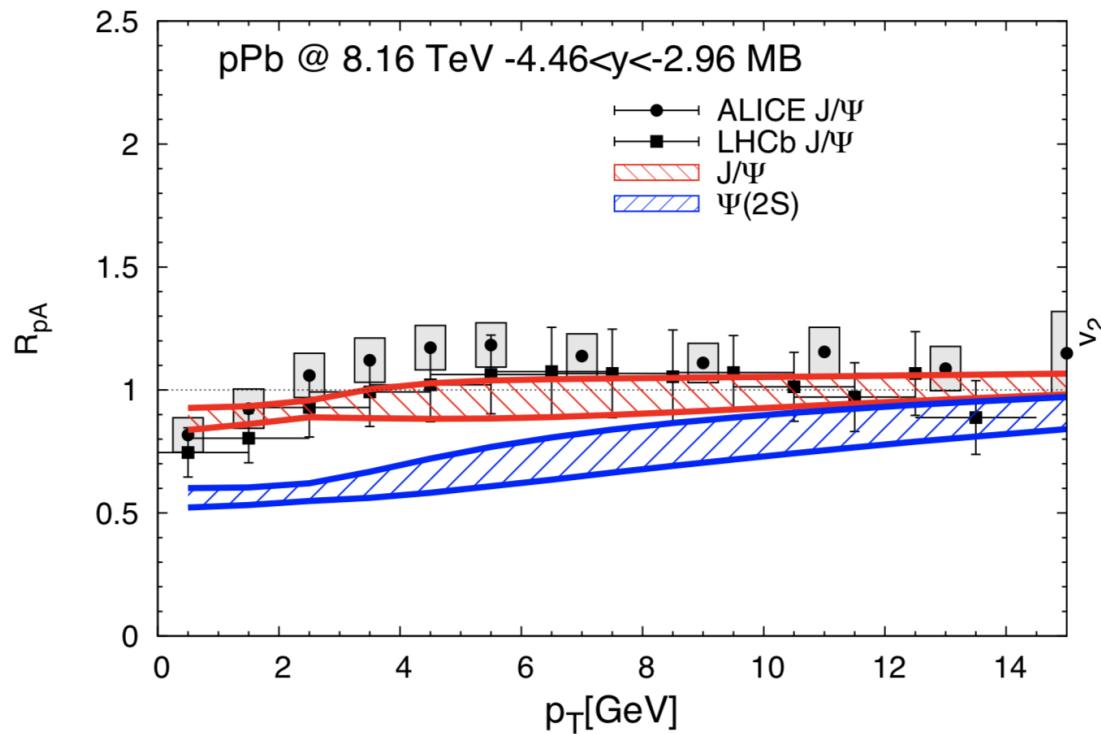

ALICE, JHEP 12 (2014) 073

(at least in first order) models give same result for $\psi(2S)$ as for J/ψ
difference predominant at low p_T ; final state effect? ...TM, TAMU: yes

...but no final state effect for J/ψ ?

A. Andronic

7

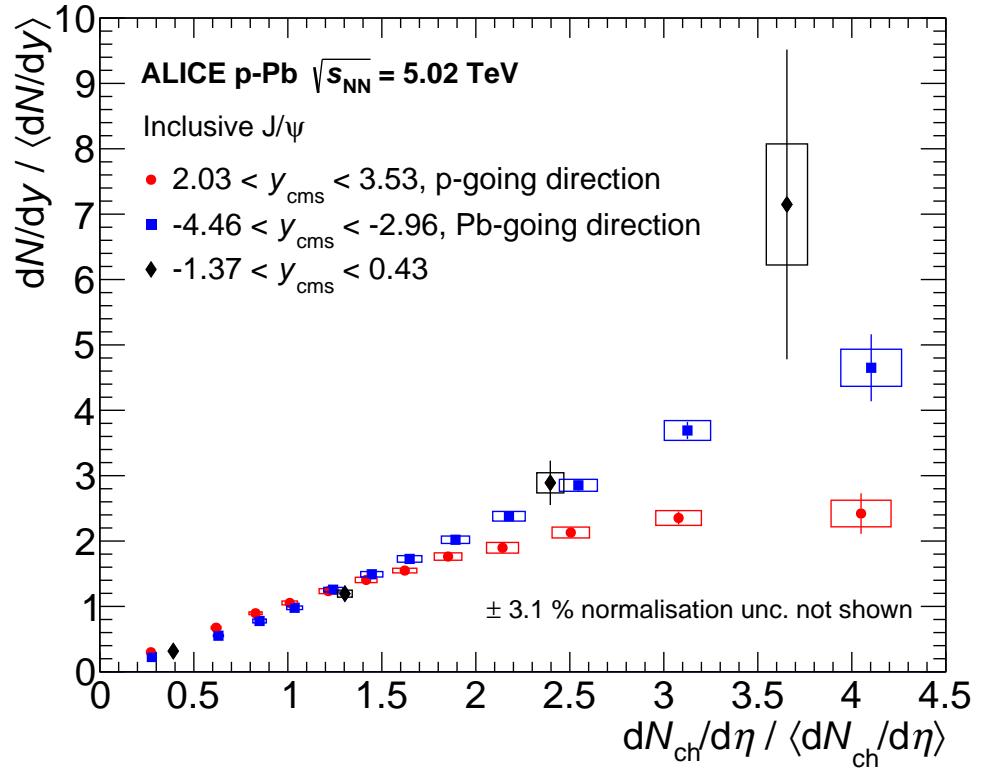

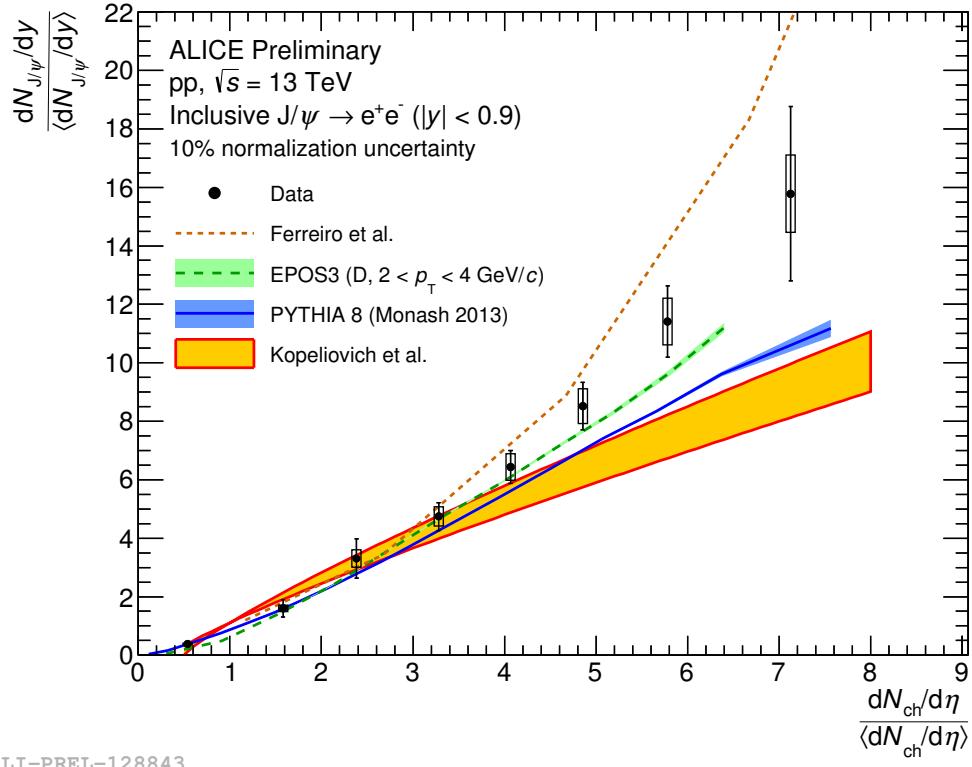

Transport Model (TAMU), Du, Rapp, [JHEP 1903 \(2019\) 015](#)

Need experimentally (in reach for Run 3,4): better precision; also v_3 ; separate B component; v_2 of $\psi(2S)$?

J/ ψ vs. event activity

A. Andronic

8

What is trivial here? (1st diagonal?) ...auto-correlation effects clearly there
"Energy cost" similar for MB event ($\Delta y=1$) and J/ ψ ($\simeq 6$ GeV)

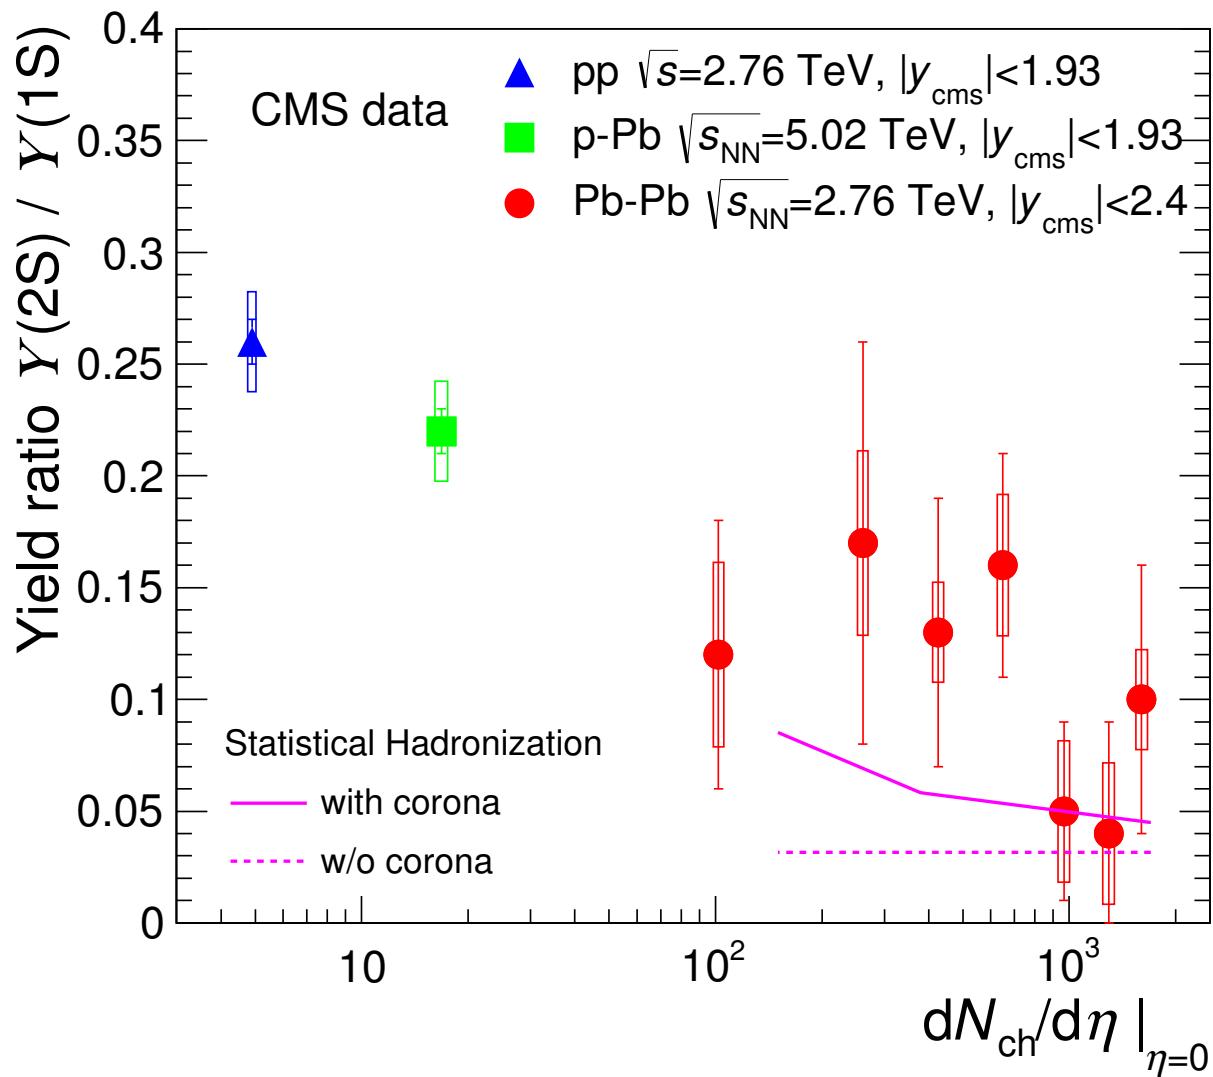

Similar behaviour measured for D mesons; Υ ; charged part. $p_T=5-6$ GeV/c

What does this teach us about quarkonium (HF) production (hadronization)?

Bottomonium at the LHC

A. Andronic

9

The data approach the thermal limit for central Pb-Pb coll.

fair description by SHM

also for R_{AA} of $\Upsilon(1S)$

Supplementary slides

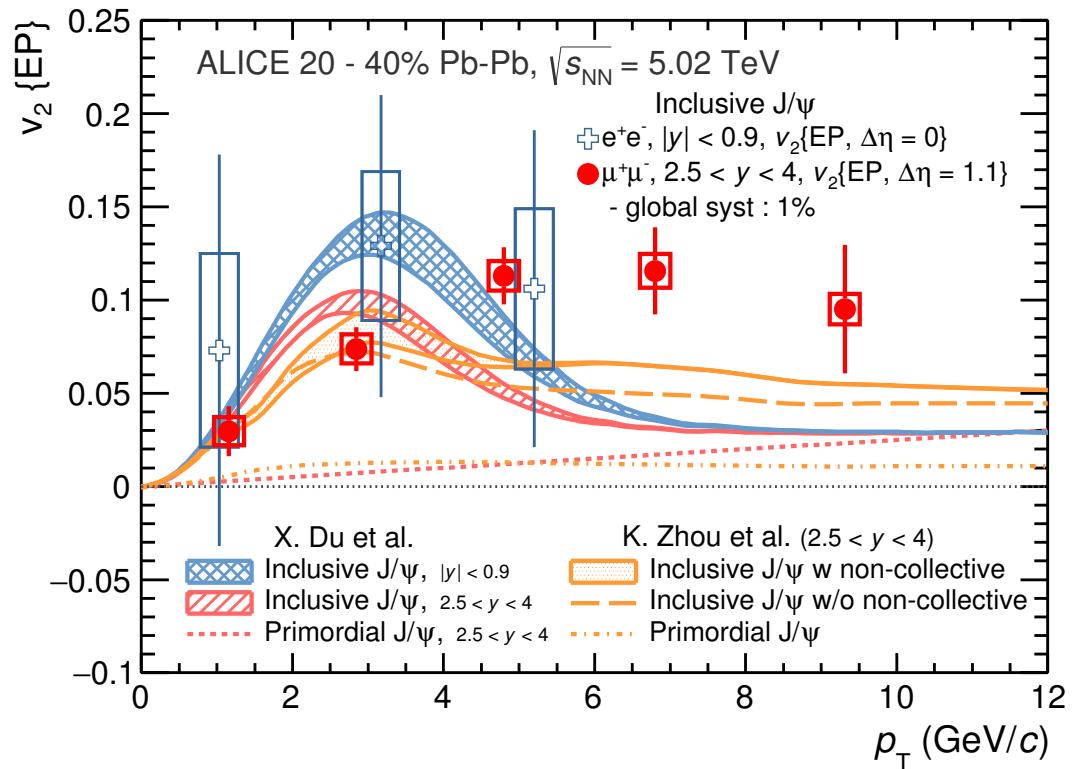

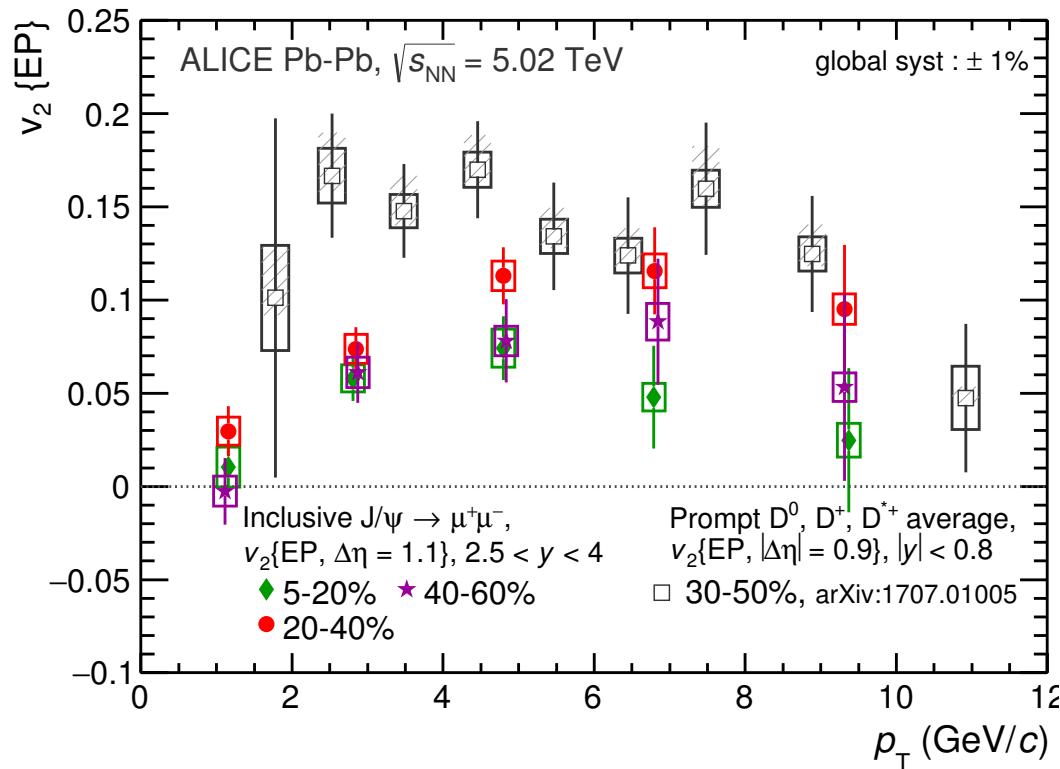

A. Andronic

10

J/ψ (and D) mesons exhibit collective flow

A. Andronic

11

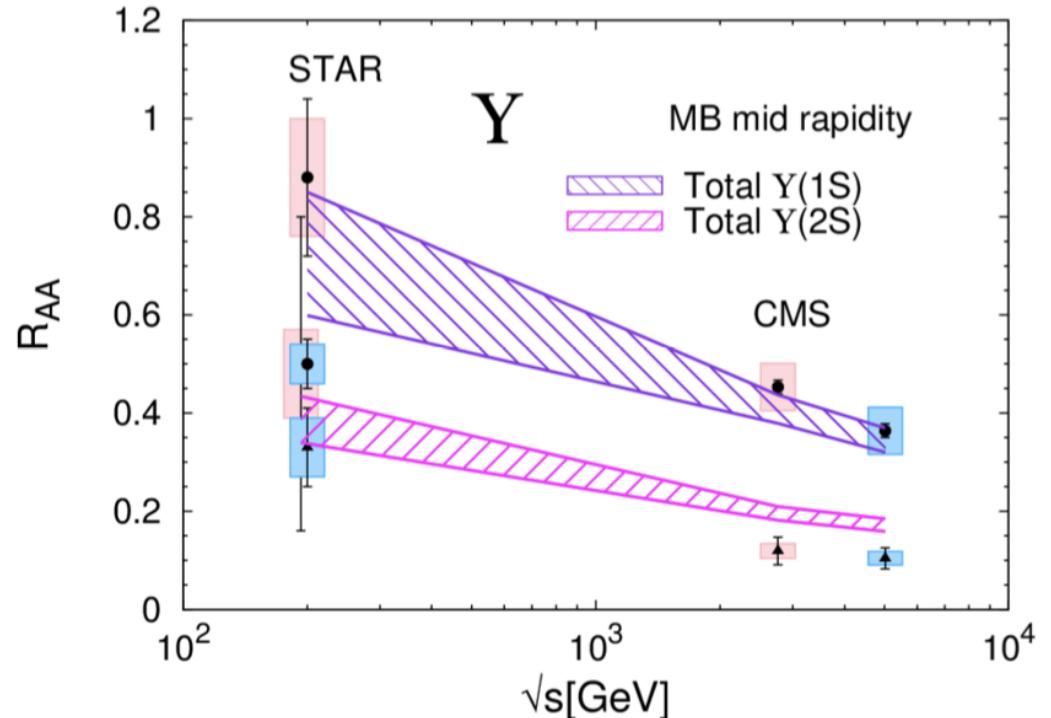

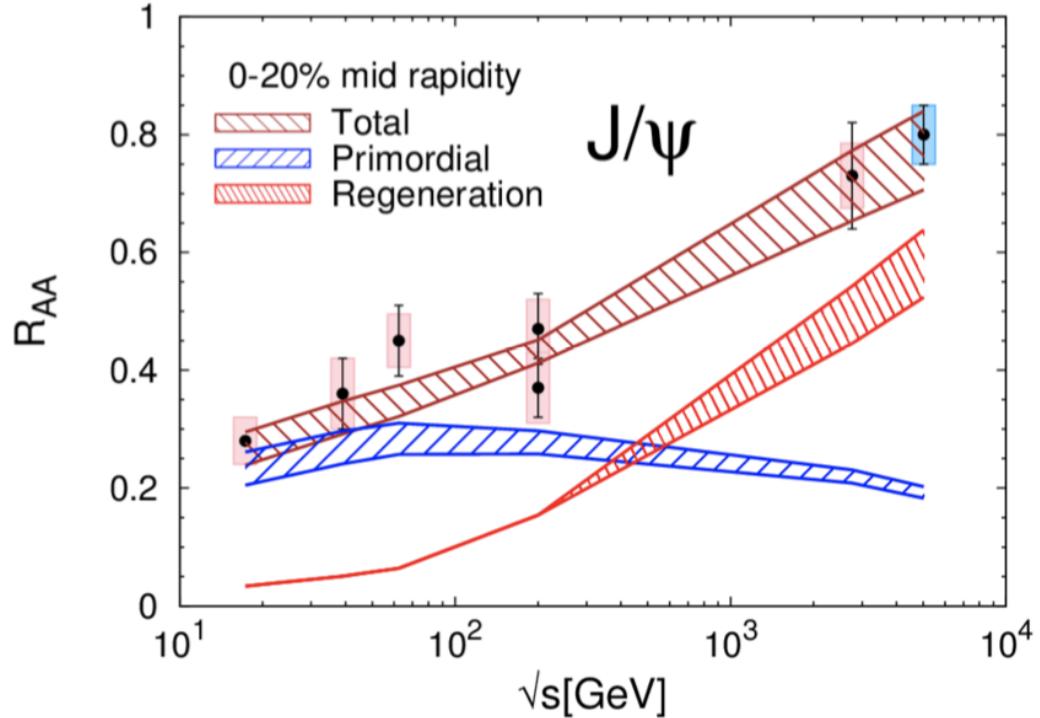

ALICE, PRL 119 (2017) 242301

Implies thermalization of charm quarks ...full thermalization? (high- p_T ?)

Fractions primordial, (re)generated - energy dependence

A. Andronic

12

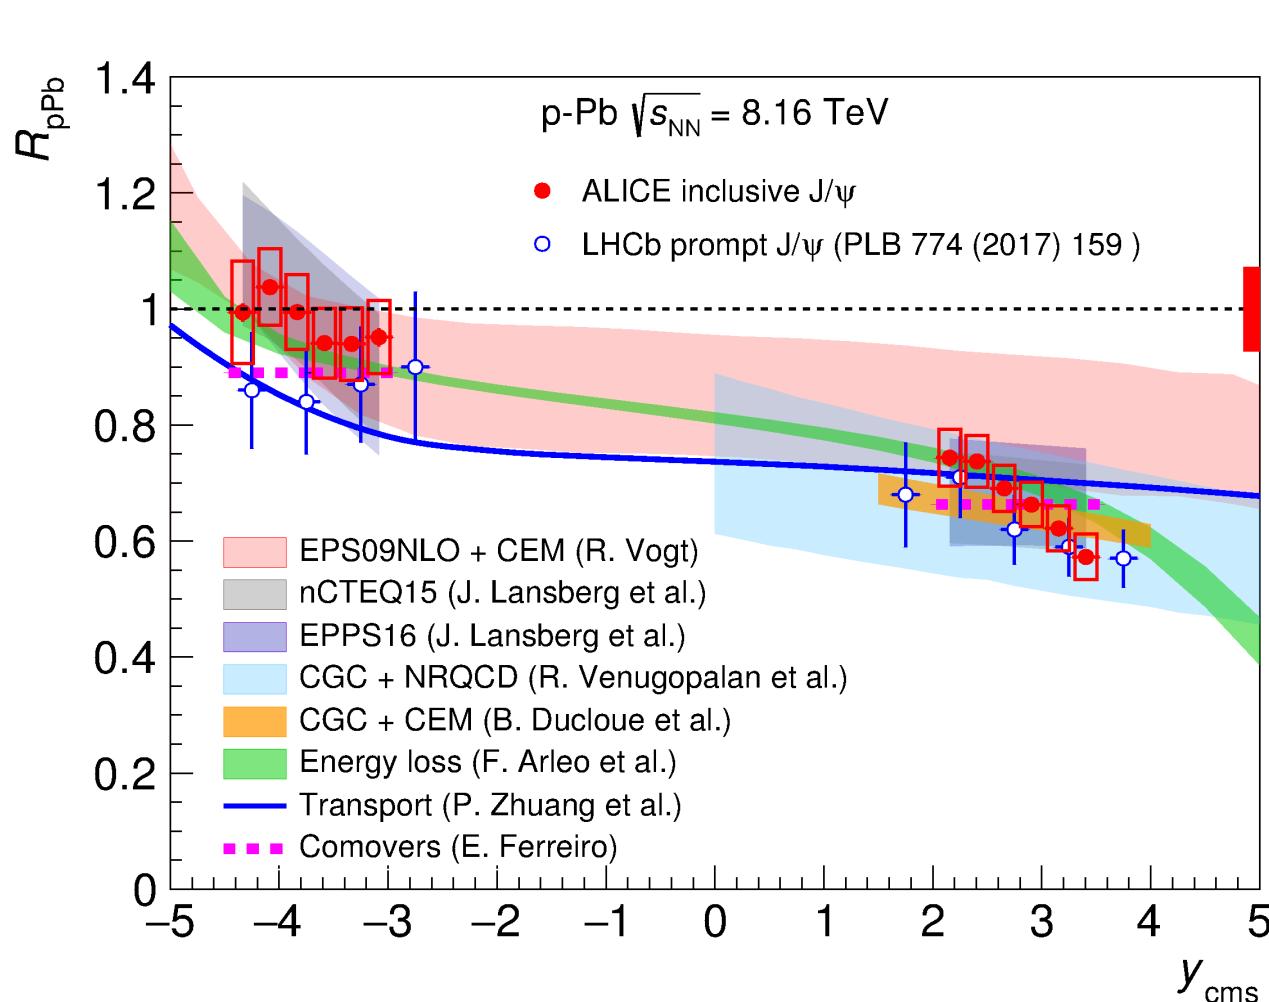

Rapp, Du, [arXiv:1704.07923](https://arxiv.org/abs/1704.07923)

J/ψ production in p–Pb collisions

A. Andronic

13

$$7 \cdot 10^{-3} \lesssim x \lesssim 3 \cdot 10^{-2}$$

$$10^{-5} \lesssim x \lesssim 5 \cdot 10^{-5}$$

$$R_{\text{pPb}} = \frac{dN_{\text{pPb}}/dp_{\text{T}}dy}{\langle N_{\text{coll}}^{\text{pPb}} \rangle \cdot dN_{\text{pp}}/dp_{\text{T}}dy}$$

$$\langle N_{\text{coll}}^{\text{pPb}} \rangle \simeq 7$$

Shadowing describes data
(shadowing uncert. are large)

Color Glass Condensate also
successful

ALICE, [JHEP 07 \(2018\) 160](#)

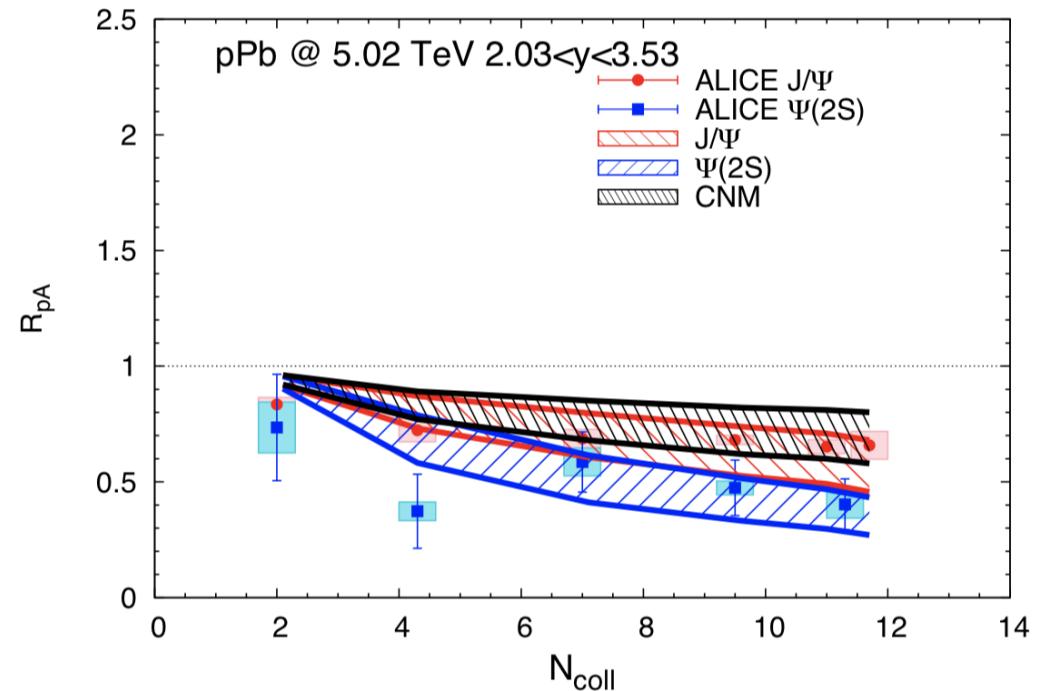

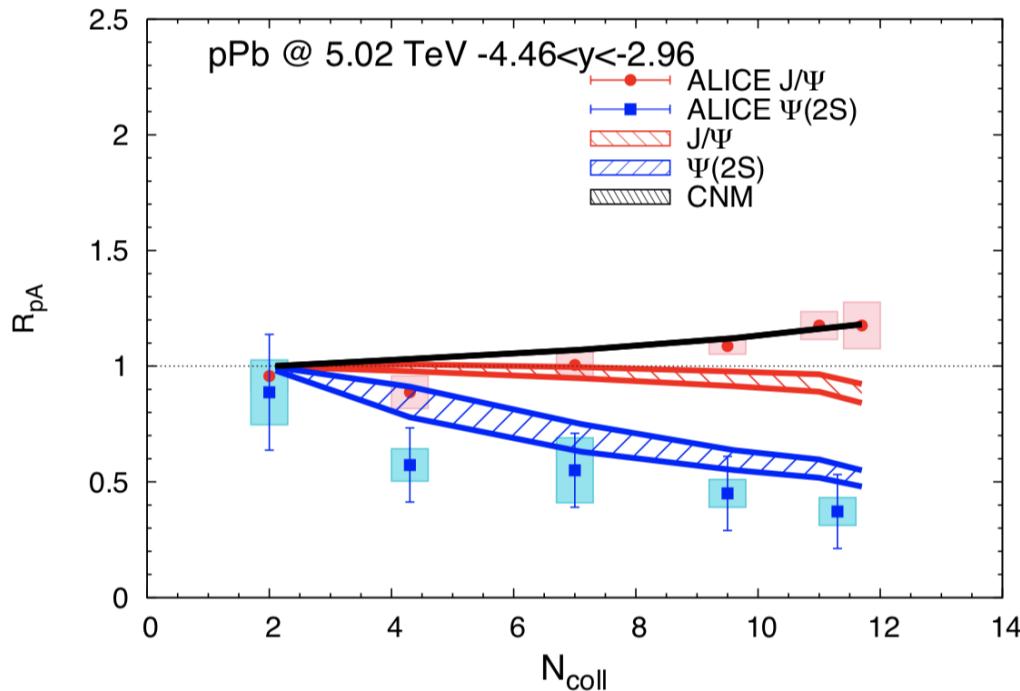

LHCb, [PLB 774 \(2017\) 159](#)

Seen also with Run 1 data (5.02 TeV): ALICE, [JHEP 02 \(2014\) 073](#), [06 \(2015\) 55](#)

\mathbf{J}/ψ and $\psi(2S)$ production in p–Pb collisions
