

LUND
UNIVERSITY

Spin, the Little Group and Spinor-Helicity

INFORMAL SCIENCE COFFEE 12 JANUARY 2021- ANDREW LIFSON

FACULTY OF
SCIENCE

Aim and Reason for these Seminars

To try and share the interesting knowledge we have gained during my PhD

First (this) seminar:

- Very informal (questions and interruptions welcome!)
- Aim to discuss fundamental physics that I only recently understood
- Hopefully useful to all
- Main topics are:
 - Wigner's Quantum Mechanics incl. little group
 - Spinor-helicity formalism
 - How they link together to calculate amplitudes

Second (next) seminar:

- More of a standard seminar
- Show our unique research (chirality-flow method)
 - Go from Feynman diagram to number via flow lines
 - Requires minimal work compared to standard methods
- Builds on many concepts from first seminar
- Is really cool

LUND
UNIVERSITY

How to classify different types of particles?

- Consider particle (state vector) ψ with Poincaré the only symmetry
 - Lorentz transformations: $p^\mu \rightarrow \Lambda^\mu_\nu p^\nu$, $U(\Lambda) = e^{-\frac{i}{2} J^{\mu\nu} \omega_{\mu\nu}}$
 - Translations: $p^\mu \rightarrow p^\mu + a^\mu$, $U(a) = e^{-i P^\mu a_\mu}$
 - Generic representation of Poincaré transformation $U(\Lambda, a)$
- What information can we know about this particle???
 - QN from translation p
 - QN from Lorentz transformations σ
- Diagonalise translation operator $P^\mu \psi_{p,\sigma} = p^\mu \psi_{p,\sigma}$

UNIVERSITY

- How to classify different types of particles $\psi_{p,\sigma}$?
- Define 'standard', simple momentum k^μ (e.g. $k^\mu = (m, 0, 0, 0)$)
- Define Lorentz transformation $L(p, k)$ s.t. $p^\mu = L(p, k)^\mu_\nu k^\nu$

Definition of a particle

$$\psi_{p,\sigma} = N(p)U(L(p, k))\psi_{k,\sigma}$$

- $N(p) \equiv$ normalisation (not important in this discussion, will be ignored)
- $U(L(p, k))$ s.t. ψ can have any representation of Lorentz group
- σ quantum number(s) unchanged by definition

Three-Point Amplitudes
Amplitude Game

LUND
UNIVERSITY

How to classify different types of particles $\psi_{p,\sigma}$?

- Consider Lorentz transformation $U(\Lambda)$ on $\psi_{p,\sigma}$

$$\begin{aligned} U(\Lambda)\psi_{p,\sigma} &= U(\Lambda) \underbrace{U(L[p])\psi_{k,\sigma}}_{\text{definition of } \psi_{p,\sigma}} = \underbrace{U(\Lambda L[p])}_{\text{representation}} \psi_{k,\sigma} \\ &= \underbrace{U(L[\Lambda p])U(L^{-1}[\Lambda p])}_{1} U(\Lambda L[p])\psi_{k,\sigma} \\ &= U(L[\Lambda p])U(L^{-1}(\Lambda p)\Lambda L[p])\psi_{k,\sigma} \\ &\quad \underbrace{\hspace{10em}}_{W(\Lambda,p)} \end{aligned}$$

- $W(\Lambda, p) \equiv$ Wigner rotation
 - Takes k back to itself, i.e. $W^\mu_\nu k^\nu = k^\mu$

Wigner Rotations and the Little Group

Three-Point Amplitudes
 Amplitude Game

LUND
UNIVERSITY

How to classify different types of particles $\psi_{p,\sigma}$?

- Consider Lorentz transformation $U(\Lambda)$ on $\psi_{p,\sigma}$

$$U(\Lambda)\psi_{p,\sigma} = U(L[\Lambda p]) \underbrace{U(L^{-1}[\Lambda p]\Lambda L[p])}_{W(\Lambda,p)} \psi_{k,\sigma}$$

k unchanged

$$= U(L[\Lambda p]) \sum_{\sigma'} D_{\sigma,\sigma'}(W[\Lambda,p]) \psi_{k,\sigma'}$$

σ unchanged

$$= \sum_{\sigma'} D_{\sigma,\sigma'}(W[\Lambda,p]) \psi_{\Lambda p,\sigma'}$$

- Wigner rotation generates the 'little group'

- Subset of Lorentz transformation leaving k^μ invariant
- Responsible for quantum numbers σ

Wigner rotation:

$W(\Lambda, p)$ leaves k invariant,
 i.e. $W^\mu_\nu k^\nu = k^\mu$

Consequences for amplitudes

Lorentz transformation of a particle

$$U(\Lambda)\psi_{p,\sigma} = D_{\sigma,\sigma'}(W[\Lambda, p])\psi_{\Lambda p,\sigma'} \Leftrightarrow U(\Lambda)|p, \sigma\rangle = D_{\sigma,\sigma'}(W[\Lambda, p])|\Lambda p, \sigma'\rangle$$

- Scattering amplitudes are of the form $\mathcal{M}_n \sim \langle \text{particles out} | \text{particles in} \rangle$
- Each particle transforms under Lorentz/little groups

Lorentz transformation of an amplitude

$$\mathcal{M}_n^\Lambda(p_i, \sigma_i) \sim \prod_{i=1}^n D_{\sigma_i, \sigma'_i}(W[\Lambda, p_i]) \mathcal{M}_n([\Lambda p]_i, \sigma'_i)$$

- Can use the little group transformation to check consistency of an amplitude
 - Can sometimes be enough to fix the amplitude!!

Particle Classification

What are the different standard momenta $k^\mu = (E, k_x, k_y, k_z)$??
(Different k^μ cannot be (proper orthochronously) Lorentz transformed into one another)

Particle type	Standard momentum k	Little group
$p^2 = m^2, p^0 > 0$	$k^\mu = (m, 0, 0, 0)$	SO(3)

Standard momentum $k^\mu = (m, 0, 0, 0)$

What are quantum numbers σ and reps $D(W)$??

- $D(W(\Lambda, p))$ representations of $so(3) \cong su(2)$
- This group is well known from non-relativistic quantum mechanics
- For particle of total spin j :
 - $\sigma = \{j^2 = j(j+1), j_s\}$ ($s \equiv$ some direction)
 - j^2 unchanged under Lorentz and little groups, j_s changes
- For infinitesimal rotations $R_{ik} = \delta_{ik} + \theta_{ik}$

$$D_{\sigma\sigma'}^{(j)}(1 + \theta) = \delta_{\sigma\sigma'} + \frac{i}{2}\theta_{ik}(J_{ik}^{(j)})_{\sigma\sigma'}$$

$$(J_{23}^{(j)} \pm iJ_{31}^{(j)})_{\sigma\sigma'} = (J_1^{(j)} \pm iJ_2^{(j)})_{\sigma\sigma'} = \delta_{\sigma', \sigma \pm 1} \sqrt{(j \mp \sigma)(j \pm \sigma + 1)}$$

$$(J_{12}^{(j)})_{\sigma\sigma'} = (J_3^{(j)})_{\sigma\sigma'} = \sigma \delta_{\sigma'\sigma}$$

Standard momentum $k^\mu = (\omega, 0, 0, \omega)$

Quantum numbers are $\sigma = a, b, \theta$

It can be shown that $W^\mu{}_\nu$ is

$$W(a, b, \theta) = \underbrace{\begin{pmatrix} 1 + \xi & a & b & -\xi \\ a & 1 & 0 & -a \\ b & 0 & 1 & -b \\ \xi & a & b & 1 - \xi \end{pmatrix}}_{S(a,b)} \underbrace{\begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos \theta & -\sin \theta & 0 \\ 0 & \sin \theta & \cos \theta & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}}_{R(\theta)}, \quad \xi = \frac{a^2 + b^2}{2}$$

$$\text{infinitesimally} \rightarrow \begin{pmatrix} 1 & a & b & 0 \\ a & 1 & -\theta & -a \\ b & \theta & 1 & -b \\ 0 & a & b & 1 \end{pmatrix} = 1 + ia \underbrace{(J_2 + K_1)}_A + ib \underbrace{(-J_1 + K_2)}_B + i\theta J_3$$

LUND
UNIVERSITY

Standard momentum $k^\mu = (\omega, 0, 0, \omega)$

Little group generated by $W^\mu{}_\nu(a, b, \theta) = 1 + iaA + ibB + i\theta J_3$

Quantum numbers are $\sigma = a, b, \theta$

Commutation relations: $[J_3, A] = iB$, $[J_3, B] = iA$, $[A, B] = 0$

To calculate a, b, θ first diagonalise a, b :

- $A\psi_{k,a,b} = a\psi_{k,a,b}$
- $B\psi_{k,a,b} = b\psi_{k,a,b}$

Then define full state as:

- $\psi_{k,a,b,\theta} \equiv e^{-i\theta J_3} \psi_{k,a,b}$

Calculate eigenvalue of A on full state:

$$\begin{aligned} A\psi_{k,a,b,\theta} &= \underbrace{e^{-i\theta J_3} e^{i\theta J_3}}_1 A \underbrace{e^{-i\theta J_3} \psi_{k,a,b}}_{\text{definition}} \\ &= e^{-i\theta J_3} \underbrace{(A \cos \theta - B \sin \theta)}_{e^{i\theta J_3} A e^{-i\theta J_3}} \psi_{k,a,b} \\ &= (a \cos \theta - b \sin \theta) \psi_{k,a,b,\theta} \end{aligned}$$

UNIVERSITY

Standard momentum $k^\mu = (\omega, 0, 0, \omega)$

Little group generated by $W^\mu{}_\nu(a, b, \theta) = 1 + iaA + ibB + i\theta J_3$

Quantum numbers are either $\sigma = a, b, \theta$, with θ continuous or

Quantum numbers are $a = b = 0$ and $j_3 = \pm j = \text{helicity}$

We don't see states with such a continuous parameter so two options:

- 1 Predict a new undiscovered type of particle
 - See e.g. hep-th:1302.1198, hep-th:1302.1577, hep-th:1302.3225, and hep-th:1404.0675
- 2 Assume $a = b = 0$ for physical states
 - Use topology to conclude that $j_3 \equiv J_3$ eigenvalue is quantised
 - $SL(2, \mathbb{C})$ is universal covering of $SO(2)$ so rotation by $4\pi \equiv \text{identity}$
 - J_3 measures spin along motion \equiv **helicity**

Conclusion: Only quantum number for massless is $\sigma = j_3 = \text{helicity}$

LUND
UNIVERSITY

Standard momentum $k^\mu = (\omega, 0, 0, \omega)$

Physical particles: little group generated by $W^\mu_\nu(a, b, \theta) = 1 + i\theta J_3$

Quantum number is $\sigma = j_3 = \text{helicity}$

Some notes:

- It is entirely natural to consider $h = +$ as a different particle to $h = -$
- If parity conserved: $\psi_{\vec{k}, \sigma} \xrightarrow{\text{parity}} \psi_{-\vec{k}, \sigma}$ so $h \rightarrow -h$
- \Rightarrow consider $h = \pm$ as two reps of same particle
- Any massless particles (e.g. graviton, photon) have exactly two d.o.f
- No concept of total spin and spin along a direction of motion

The two quadratic Casimirs of Poincaré algebra

$$P^2 = m^2 \text{ and } W^2 = -m^2 j(j+1) \stackrel{m=0}{=} -\omega^2(A^2 + B^2)$$

- $P_\mu = i \frac{\partial}{\partial x^\mu}$ generates translations
- $W^\mu = -\frac{1}{2} \epsilon^{\mu\nu\lambda\omega} P_\nu J_{\lambda\omega}$ generates little group
- W^μ called Pauli-Lubanski pseudovector
- $(W^\mu/m)^2 = -j(j+1) \Rightarrow W^\mu/m$ is a covariant spin operator!

Covariant (massive) spin-1/2 operator

Using Pauli-Lubanski (pseudo)vector

$$\frac{1}{2}\Sigma^\mu \equiv \frac{W^\mu}{m} = -\frac{1}{4m}\epsilon^{\mu\nu\lambda\omega}P_\nu\sigma_{\lambda\omega}, \quad \sigma^{\mu\nu} = \frac{i}{2}[\gamma^\mu, \gamma^\nu] \stackrel{\text{spin-1/2}}{=} 2J^{\mu\nu}$$

- Check Σ^μ for the rest frame $P^\mu \rightarrow k^\mu = (m, 0, 0, 0)$

$$\frac{1}{2}\Sigma^i \stackrel{\text{rest}}{=} \frac{i}{4}\epsilon^{ijk}\gamma^j\gamma^k = \frac{1}{2}\gamma^5\gamma^0\gamma^i = \frac{1}{2}\begin{pmatrix} \sigma^i & 0 \\ 0 & \sigma^i \end{pmatrix}, \quad \frac{1}{2}\Sigma^0 \stackrel{\text{rest}}{=} 0,$$

- We can measure Σ^μ in direction $s^\mu, s^\mu \stackrel{\text{rest}}{=} (0, \hat{s})$ using

$$-\frac{\Sigma^\mu s_\mu}{2} = \frac{1}{4m}\epsilon^{\mu\nu\lambda\omega} s_\mu P_\nu \sigma_{\lambda\omega}$$

- Above shows $s \cdot P = \Sigma \cdot P = 0, s^2 = -1$ and (with a bit of algebra)

$$-\frac{\Sigma^\mu s_\mu}{2} = \frac{1}{2m}\gamma^5 \cancel{\not{P}} = \underbrace{\frac{1}{2}\gamma^5}_{\cancel{\not{P}}\psi = m\psi} \equiv \text{operator measuring spin of spinor along } s^\mu$$

Helicity basis means each particle has a specific helicity
Lorentz algebra $so(3, 1) \cong su(2) \oplus su(2)$
Consider massless particles

- Ideal for (approximately) massless particles (e.g. most particles at LHC)
 - Helicity is the quantum number of the massless little group
 - For incoming (anti)spinors chirality $((\frac{1}{2}, 0)$ or $(0, \frac{1}{2})) \sim$ helicity $(-\frac{1}{2}$ or $+\frac{1}{2})$
 - For outgoing (anti)spinors chirality $((\frac{1}{2}, 0)$ or $(0, \frac{1}{2})) \sim$ helicity $(-\frac{1}{2}$ or $+\frac{1}{2})$
- Amplitude itself is a number rather than a matrix
 - Easy to square
- Different helicity amplitudes are orthogonal
 - Only sum over helicities after squaring

Spinor-Helicity: its Building Blocks

Lorentz algebra $so(3, 1) \cong su(2) \oplus su(2)$
Consider massless particles: chirality \sim helicity

Spinors (use chiral basis):

$$u^+(p) = v^-(p) = \begin{pmatrix} 0 \\ |p\rangle \end{pmatrix} \quad u^-(p) = v^+(p) = \begin{pmatrix} |p] \\ 0 \end{pmatrix}$$

$$\bar{u}^+(p) = \bar{v}^-(p) = ([p| \quad 0) \quad \bar{u}^-(p) = \bar{v}^+(p) = (0 \quad \langle p|)$$

$$\gamma^5 = \begin{pmatrix} -1 & 0 \\ 0 & 1 \end{pmatrix} \quad P_{L/R} = \frac{1 \mp \gamma^5}{2}$$

- Amplitude written in terms of Lorentz-invariant spinor inner products

$$\langle ij \rangle = -\langle ji \rangle \equiv \langle i||j \rangle \quad \text{and} \quad [ij] = -[ji] \equiv [i||j]$$

- These are well known complex numbers, $\langle ij \rangle \sim [ij] \sim \sqrt{2p_i \cdot p_j}$
- Cannot contract left and right: $\langle i||j \rangle \equiv \bar{u}(p_i) P_R P_L u(p_j) = 0$
 - Objects live in different Lorentz reps so a contraction makes no sense!

Spinor-Helicity and the Little Group

Three-Point Amplitudes
Amplitude Game

LUND
UNIVERSITY

Lorentz algebra $so(3, 1) \cong su(2) \oplus su(2)$
Consider massless particles: chirality \sim helicity

Outgoing polarisation vectors:

$$\epsilon_+^\mu(p, r) = \frac{\langle r | \bar{\tau}^\mu | p \rangle}{\langle rp \rangle}, \quad \epsilon_-^\mu(p, r) = \frac{[r | \tau^\mu | p \rangle}{[pr]}$$

- r is a (massless) arbitrary reference momentum ($p \cdot r \neq 0$)
- Different r choices correspond to different gauges

$$\epsilon_+^\mu(p, r') - \epsilon_+^\mu(p, r) = -p^\mu \frac{\langle r' r \rangle}{\langle r' p \rangle \langle rp \rangle}$$

- Gauge invariant quantities must be r -invariant
 - Choose r as conveniently as possible (remember $\langle ij \rangle = -\langle ji \rangle$ s.t. $\langle ii \rangle = 0$)
 - Variance under $r \rightarrow r'$ good check of gauge invariance of (partial) amplitude

Another Spinor-Helicity Example: $e^+ e^- \rightarrow \gamma\gamma$

Little Group

Group of transformations that leaves p^μ invariant

- Recall: $\not{p} = |p\rangle\langle p|$ and $\bar{\not{p}} = |p\rangle[p|$
- \Rightarrow under little group transformation:
 - $\langle p| \rightarrow t\langle p|$ and $|p\rangle \rightarrow t|p\rangle$
 - $[p| \rightarrow t^{-1}[p|$ and $|p\rangle \rightarrow t^{-1}|p\rangle$
 - $p \in \mathbb{R} \Rightarrow t = e^{i\theta/2} = e^{i\theta|h}$
 - $p \in \mathbb{C} \Rightarrow t$ more general
- Recall: $\epsilon_+^\mu(p, r) = \frac{\langle r|\bar{\tau}^\mu|p\rangle}{\langle rp\rangle}$ and $\epsilon_-^\mu(p, r) = \frac{[r|\tau^\mu|p\rangle}{[pr]}$ (p outgoing)
- \Rightarrow under little group transformation:
 - $\epsilon_+^\mu \rightarrow t^{-2}\epsilon_+^\mu$
 - $\epsilon_-^\mu \rightarrow t^2\epsilon_-^\mu$

Amplitude Game

LUND
UNIVERSITY

Recall: three-point amplitudes completely fixed by little group

Basic (oversimplified) idea of BCFW:

- Take known compact form of n -point amplitude
- Sum over all possible three-point amplitude attachments
- Write down compact form of $(n + 1)$ -point amplitude
- Recurse

Example: MHV (Maximally Helicity Violating) amplitude for n -gluon scattering

$$\mathcal{M}_n(1^-, 2^-, 3^+, \dots, n^+) = \frac{\langle 12 \rangle^4}{\langle 12 \rangle \langle 23 \rangle \dots \langle n1 \rangle}$$

(see hep-th:0501052 and hep-ph:1308.1697 for BCFW details)

Required Knowledge

$$\mathcal{M}(|i\rangle, |j\rangle, h_i) \xrightarrow{\text{little group}} \mathcal{M}(t|i\rangle, t^{-1}|j\rangle, h_i) = t^{-2h_i} \mathcal{M}(|i\rangle, |j\rangle, h_i)$$

$$[\mathcal{M}_n] = [\rho]^{4-n} \text{ and } [\langle ij \rangle] = [[ij]] = [\rho]$$

All particles outgoing

Questions: (i) What are helicities? (ii) What dimension is coupling? (iii) What theory?

$$\text{Amplitude 1: } \mathcal{M}_5 = g_1 \frac{[13]^4}{[12][23][34][45][51]}$$

$$\text{Amplitude 2: } \mathcal{M}_4 = g_2 \frac{\langle 14 \rangle \langle 24 \rangle^2}{\langle 12 \rangle \langle 23 \rangle \langle 34 \rangle}$$

$$\text{Amplitude 3: } \mathcal{M}_4 = g_3 \frac{\langle 12 \rangle^7 [12]}{\langle 13 \rangle \langle 14 \rangle \langle 23 \rangle \langle 24 \rangle \langle 34 \rangle^2}$$

Game taken from section 2.6 of hep-ph:1308.1697

Game Time: Answer to First Amplitude

Wigner's Quantum Mechanics

Poincaré and little groups
Massive Particles and Spin
Massless Particles and Helicity
Covariant Operators P and W

Spinor-Helicity Formalism

Traditional ME example
Basics of Spinor Helicity
Simple Spinor-Hel Example
Gauge Bosons and Example

Spinor-Helicity and the Little Group

Three-Point Amplitudes
Amplitude Game

LUND
UNIVERSITY

Required Knowledge

$$\mathcal{M}(|i\rangle, |j\rangle, h_i) \xrightarrow{\text{little group}} \mathcal{M}(t|i\rangle, t^{-1}|j\rangle, h_i) = t^{-2h_i} \mathcal{M}(|i\rangle, |j\rangle, h_i)$$

$$[\mathcal{M}_n] = [\rho]^{4-n} \text{ and } [\langle ij \rangle] = [[ij]] = [\rho]$$

All particles outgoing

Questions: (i) What are helicities? (ii) What dimension is coupling? (iii) What theory?

$$\text{Amplitude 1: } \mathcal{M}_5 = g_1 \frac{[13]^4}{[12][23][34][45][51]}$$

$$(i) \text{ E.g. particle 1 under little group: } \mathcal{M}_5 \rightarrow \frac{t_1^{-4}}{t_1^{-2}} \mathcal{M}_5 \Rightarrow h_1 = 1$$

$$\text{All particles: } h_1 = h_3 = -h_2 = -h_4 = -h_5 = 1$$

$$(ii) [\mathcal{M}_5] = -1 = \left[\frac{[13]^4}{[12][23][34][45][51]} \right] \Rightarrow [g_2] = 0$$

(iii) Yang Mills (spin-1 massless particles interacting)

Basics of Spinor Helicity
Simple Spinor-Hel Example
Gauge Bosons and Example

Spinor-Helicity and the Little Group

Three-Point Amplitudes
Amplitude Game

LUND
UNIVERSITY

- Particles classified by their representation under *both* Lorentz and little groups
- Massive particles have total spin and spin along a given direction
- Massless particles only have helicity
- Spinor-helicity formalism simplifies amplitude calculations since amplitude is a complex number
- Using both spinor-helicity and the little group recursive amplitude calculations possible
 - These skip Feynman diagram step
 - Far more efficient
